Community Led Exchange and Aggregate Reporting (CLEAR)

CLEAR helps us understand how immunization information systems (IIS) support real-time HL7 interoperability across the nation. We're asking IIS to share the volume of HL7 v2 updates and queries they're processing each month.

Your data is valuable and will be shared with other IIS participants. You'll be able to see what others are reporting. Externally, we'll publish only an aggregate national estimate to help communicate the vital services IIS are providing and demonstrate that interoperability is working nationwide.

Together, we're building a picture of the real-world impact of standardized data exchange in immunization systems.

National Estimates

These values are estimates derived from reported IIS/state data.

Year 2026

Estimated National Updates

Month	Count	Low Estimate	Average Estimate	High Estimate
January	7	24,372,840	24,731,512	35,348,740
February	7	17,776,297	24,233,266	28,066,596
March	7	21,617,545	26,632,485	27,723,156
April	7	18,709,802	29,607,204	74,202,984

Estimated National Queries

Month	Count	Low Estimate	Average Estimate	High Estimate
January	7	224,478,516	392,650,824	525,787,847
February	7	247,952,339	410,929,289	440,132,006
March	7	265,780,400	622,616,042	437,547,739
April	7	248,229,990	606,773,183	432,773,296

How estimates are calculated: for each month, CLEAR uses only IIS/state reports received for that month. For each reporting IIS/state, a rate is calculated as reported count divided by that IIS/state population. Low Estimate uses the 25th percentile of these rates, Average Estimate uses the population-weighted reporting rate (total reported count divided by total reporting population), and High Estimate uses the 75th percentile. Each rate is then scaled to the national population to produce the monthly national estimate. These values are estimates of national activity based on reporting IIS/state data, not exact totals.
